Language Typology and Universals

Typology:- Types of languages, to categorise

Universals:- Similarities, features present across (all) languages

Hockett's features of language

Refer ITL-1's notes, but ~~Semi~~ Discreteness'. defn is incorrect, is actually Duality of Patterning

Check Wiki

· Find defn of Discreteness

Prevarication (lying) is a result of displacement, unique to humans

Redundancy:- Multiple ways of referring to the same thing, ~~intonation~~ intonation, inflection, markers, etc.

Reflexiveness:- Ability to talk about language itself

There must be a thread of discourse, a continuity b/w the sentences

Approaches

Mentalism vs Behaviourism

Innate ability to acquire lang

Acq from surroundings / env.

Communication System: Does not satisfy all of Hockett's feature

Lexical changes
Morphological and Syntactic changes
Spelling and Pronunciation changes
Borrowing

Language change is diachronic

Different languages might be having ~~of~~ the same sound and same root but different meanings

आलोचना , ~~अभि~~ अभिमान

Grimm's Laws, Great Vowel Shift

Language Change
Sound – ~~Pronoun~~ Pronunciation
Lexical – Vocabulary
Morphological
Syntactical
Semantical (senses)
↳ file ⇒ old = +physical
⇒ modern = need not be +physical

Addition, Deletion & Substitution
(Change can be initial, final, or in the middle (and more))

Borrowing + Nativization
↳ Rules of nativization must be applied
पुलिस, अक्टूबर, छात्रा, एक छोटा
For example, consonant clusters result in addition or deletion

Regular change :- Universal across languages
Non regular / Irregular / Sporadic change :- Only for specific cases, not a general rule

Unconditioned Sound Change :- Not dependent on phonetic context

Conditioned Sound Change :- Only occurs in specific phonetic contexts

Non-phonemic Change (Allophonic change) :- Does not alter total no. of phonemes in the lang (changes one phoneme into another). Also called shifts. Do not change the structural organization of the inventory of sounds

Phonemic Change :- Affects the phonetic inventory of the speakers by adding, deleting and changing from one to another

(i) Merger (A, B > B or A, B > C)

(ii) Split (A > B, C)

Splits follow mergers

Assimilation :-

total - partial, contact - distant, regressive - progressive

↓ becomes identical, takes on all its phonetic features

↓ takes on a few phonetic features

↓ direction of influence

dogs vs अंत

Dissimilation Sounds becoming dissimilar

Grassman's Law :- Regular Dissimilation in Greek & Sanskrit

Deletions

(i) Syncope :- ataka → atka

Deletion of a vowel from the interior of a word.

(ii) Apocope :- tata → tat
Elision of a sound, usually a vowel at the end of a word.

(iii) Aphaeresis :- atata → tata
Deletion of the initial sound (usually a vowel) from the word.

Insertions

(i) Epentheses :- asta → acata
Insertion of a sound into ~~the middle of~~ a word.

(a) Prothesis :- tata → atata
Prefixing a sound to a word (addition at the front)

(b) ~~Ag~~ Anaptyxis :- VCCV → VCVCV
Insertion of a vowel b/w two consonants

(c) Excrescence :- anra → ambra ; anra → andra ; ansa → antsa
Insertion of a consonant b/w other consonants usually resulting in phonetic clusters that are easier to pronounce.

(d) Paragoge :- tat → tata
Suffixing a word with a sound, usually a vowel.

Compensatory Lengthening :- tast → ta:t
Some sound is lost and another segment, usually a vowel is lengthened.

Rhotacism :- VsV → VrV
Change where an 's' [z] becomes an 'r', usually b/w vowels or glides. Probable flow:
/s/ → /z/ → /r/

Metathesis:- asta → atsa; asata → atasa.
Transposition of sounds, change in which sounds exchange positions with one-another within the word. Usually sporadic

Haplology:- tatasa → tasa
Repeated sequence of sounds is simplified.

Breaking:-
~~Diphthog~~ Diphthongization of short vowels in particular contexts.

Other Sound Changes
(i) Final devoicing
Devoicing the final sound (or syllable) in the word, usually plosives, sonorants or vowels

(ii) Intervocalic voicing (and voicing in general)
Very common for sounds b/w vowels to be voiced.

(iii) Nasal assimilation
Nasals are changed to agree with the point of articulation of the following consonant (usually a stop)

(iv) Palatalization
→ Typical change of a velar or alveolar to a palato-alveolar sound
→ Consonants take on palatalization as a secondary manner of articulation.

(v) ~~Dipth~~ Diphthongization:
Monophthong splits into two vowel ~~sort~~ sounds that occupy the same nucleus.

(vi) Monophthongization.

(vii) Vowel raising

(viii) Vowel lowering

(ix) Nasalization

(x) Lenition
Weakening of articulation
stops/affricates → fricatives ; consonants → glides, two consonants → one

(xi) Strengthening

(xii) Gemination
Doubling of consonants

(xiii) Degemination

(xiv) Affrication
Plosive / Fricatives → Affricates

(xv) Spirantization [Fricativization]
Plosive / Affricates → Fricatives

(xvi) Deaffrication

(xvii) Lengthening
Usually vowels

(xviii) Shortening

Vowel Harmony:-

manishi + lu = manushulu
intervalin
but doesn't hold for borrowed words

benchi + lu = benchiilu

Chain shift:-

change pushes another sound out of the system

Pull chains & Push chains
↓
change creates vacancies in the phonemic pattern that are filled by other changes

Grimm's Law:-

voiced aspirated plosive → voiced ~~stop~~ plosive

voiced plosive → voiceless plosive

voice less plosive → voiceless fricative

Great Vowel Shift
